Prof. Dr. Mathias Scheurer

Institute for Theoretical Physics III, University of Stuttgart

Information on lecture and tutorials

Here a few infos on the modalities of the course "Fortgeschrittene Quantentheorie":

- You can find detailed information on lecture and tutorials on the website of our institute:
 - https://itp3.info/fqt2425
- Written problems have to be handed in via ILIAS and will be corrected by the tutors. You must earn at least 50% of the written points to be admitted to the exam.
- **Oral** problems have to be prepared for the exercise session and will be presented by a student at the blackboard. You must earn at least **66**% of the oral points to be admitted to the exam.
- Every student is required to **present** at least **3** of the oral problems at the blackboard to be admitted to the exam.
- Problems marked with an asterisk (*) are optional and can earn you bonus points.
- If you have questions regarding the problem sets, feel free to contact your tutor at any time.

Problem 1.1: Foundations of Quantum Mechanics

[Written | 6 pt(s)]

ID: ex_foundations_of_quantum_mechanics:fqt2425

Learning objective

This problem reviews key concepts of quantum mechanics and its mathematical framework. It is based on the paper *Student understanding of quantum mechanics*, C. Singh, Am. J. Phys. **69**, 885 (2001); http://dx.doi.org/10.1119/1.1365404. The main goal is to address and eliminate common misconceptions.

We refer to a generic observable Q and its corresponding quantum mechanical operator \hat{Q} . For all of the questions, the Hamiltonian and operators \hat{Q} do not depend on time explicitly.

- a) The eigenvalue equation for an operator \hat{Q} is given by $\hat{Q} |\psi_i\rangle = \lambda_i |\psi_i\rangle$, where i = 1, ..., N. $\mathbf{1}^{\text{pt(s)}}$ Write an expression for $\langle \phi | \hat{Q} | \phi \rangle$, where $|\phi\rangle$ is a general state, in terms of the amplitudes $\langle \phi | \psi_i \rangle$.
- b) If you make measurements of a physical observable Q on a system in immediate succession, do $1^{pt(s)}$ you expect the outcome to be the same every time? Justify your answer.
- c) If you make measurements of a physical observable Q on an ensemble of identically prepared systems which are not in an eigenstate of \hat{Q} , do you expect the outcome to be the same every time? Justify your answer.
- d) A particle is in a one-dimensional harmonic oscillator potential. Under what conditions will the $1^{\text{pt(s)}}$ expectation value of an operator \hat{Q} depend on time if
 - i. the particle is initially in a momentum eigenstate?
 - ii. the particle is initially in an energy eigenstate?

Justify your answer in both cases.

e) Questions (i)-(ix) refer to the following system: An electron is in a uniform magnetic field $B_{z^{pt(s)}}$ which is pointing in the z-direction. The Hamiltonian for the spin-degree of freedom for this system is given by $\hat{H} = -\gamma B \hat{S}_z$, where γ is the gyromagnetic ratio and \hat{S}_z is the z-component of the spin angular momentum operator.

Notation: $\hat{S}_z |\uparrow\rangle = \hbar/2 |\uparrow\rangle$, $\hat{S}_z |\downarrow\rangle = -\hbar/2 |\downarrow\rangle$. For reference, the unnormalized eigenstates of \hat{S}_x and \hat{S}_y are given by

$$\hat{S}_x(|\uparrow\rangle \pm |\downarrow\rangle) = \pm\hbar/2(|\uparrow\rangle \pm |\downarrow\rangle) \tag{1}$$

$$\hat{S}_{y}(|\uparrow\rangle \pm i |\downarrow\rangle) = \pm \hbar/2(|\uparrow\rangle \pm i |\downarrow\rangle).$$
⁽²⁾

- i. If you measure S_z of a state $|\chi\rangle = (|\uparrow\rangle + |\downarrow\rangle)/\sqrt{2}$, what are the possible results, and what are their respective probabilities?
- ii. If the result of the first measurement of $S_z \max \hbar/2$, and you immediately measure S_z again, what are the possible results, and what are their respective probabilities?
- iii. If the result of the first measurement of $S_z \max \hbar/2$, and you immediately measure S_x , what are the possible results, and what are their respective probabilities?
- iv. What is the expectation value $\langle \hat{S}_z \rangle$ of the state $|\chi\rangle = (|\uparrow\rangle + |\downarrow\rangle)/\sqrt{2}$?
- v. If the electron is initially in an eigenstate of \hat{S}_x , does the expectation value of \hat{S}_y depend on time? Justify your answer.
- vi. If the electron is initially in an eigenstate of \hat{S}_x , does the expectation value of \hat{S}_z depend on time? Justify your answer.
- vii. If the electron is initially in an eigenstate of \hat{S}_z , does the expectation value of \hat{S}_x depend on time? Justify your answer.
- viii. If the electron is initially in an eigenstate of \hat{S}_z , does the expectation value of \hat{S}_z depend on time? Justify your answer.
- ix. If the electron is initially in an eigenstate of \hat{S}_x , does the expectation value of \hat{S}_x depend on time? Justify your answer.

Problem 1.2: Spin s = 1/2 particles

[Oral | 4 pt(s)]

ID: ex_pauli_matrices_aqm:fqt2425

Learning objective

This exercise aims to review some properties of Pauli matrices for spin s = 1/2 particles while providing an opportunity to familiarize oneself with algebra involving Levi-Civita and Kronecker Delta symbols, which are commonly used in Quantum Mechanics.

For a particle with spin s = 1/2, the Pauli matrices can be defined as

$$\hat{\sigma}_1 = \hat{\sigma}_x = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \hat{\sigma}_2 = \hat{\sigma}_y = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \text{ and } \hat{\sigma}_3 = \hat{\sigma}_z = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}.$$
 (3)

with the following multiplication rule

$$\hat{\sigma}_i \hat{\sigma}_j = \delta_{ij} \mathbb{I}_2 + i \varepsilon_{ijk} \hat{\sigma}_k \quad \text{with} \quad i, j, k = 1, 2, 3.$$
(4)

The Levi-Civita symbol in a three-dimensional space is represented as

$$\varepsilon_{ijk} = \begin{cases} +1 & \text{if } (i, j, k) \text{ is } (1, 2, 3), (2, 3, 1), \text{ or } (3, 1, 2), \\ -1 & \text{if } (i, j, k) \text{ is } (3, 2, 1), (1, 3, 2), \text{ or } (2, 1, 3), \\ 0 & \text{if } i = j, \text{ or } j = k, \text{ or } k = i, \end{cases}$$
(5)

i.e., it takes values +1 (-1) for even (odd) permutations of the indices (i, j, k) = (1, 2, 3) or 0 if any index is repeated. The Kronecker Delta is simply defined as

$$\delta_{ij} \equiv \begin{cases} 0 & \text{for } i \neq j, \\ 1 & \text{for } i = j. \end{cases}$$
(6)

a) Using property (4) prove that

$$(\mathbf{a} \cdot \boldsymbol{\sigma}) (\mathbf{b} \cdot \boldsymbol{\sigma}) = \mathbf{a} \cdot \mathbf{b} \mathbb{I}_2 + i (\mathbf{a} \times \mathbf{b}) \cdot \boldsymbol{\sigma} \quad \text{where} \quad \mathbf{a}, \mathbf{b} \in \mathbb{R}^3.$$
(7)

- b) Show that (i) $[\mathbf{a} \cdot \boldsymbol{\sigma}, \mathbf{b} \cdot \boldsymbol{\sigma}] = 2i(\mathbf{a} \times \mathbf{b}) \cdot \boldsymbol{\sigma}$ and (ii) $\operatorname{Tr}(\mathbf{a} \cdot \boldsymbol{\sigma} \mathbf{b} \cdot \boldsymbol{\sigma}) = 2\mathbf{a} \cdot \mathbf{b}$ with equation (7). $\mathbf{2}^{\operatorname{pt}(s)}$
- c) Find the eigenvalues and normalized eigenfunctions of the operators $\hat{S}_i = \hbar \hat{\sigma}_i / 2$ for i = x, y, z. $\mathbf{1}^{\text{pt(s)}}$

Problem 1.3: Commutators

ID: ex_commutators_2:fqt2425

Learning objective

We review some important commutation relations with focus on the position \hat{x} , linear momentum \hat{p} , and angular momentum \hat{L} operators.

a) Show that the following identity holds for commutators of products

$$[A, BC] = B[A, C] + [A, B]C.$$
(8)

b) Let $g(\hat{x})$ and $f(\hat{p})$ be analytical functions of the position and momentum operators, respectively. 1^{pt(s)} Show that

$$[\hat{p}, g(\hat{x})] = -i\hbar \frac{\mathrm{d}}{\mathrm{d}x} g(\hat{x}) , \qquad (9)$$

$$[\hat{x}, f(\hat{p})] = +i\hbar \frac{\mathrm{d}}{\mathrm{d}p} f(\hat{p}) \,. \tag{10}$$

c) Using the previous exercises, calculate the following commutators involving the canonical position and momentum operators \hat{x} and \hat{p}

$$[\hat{x}, \hat{p}^2], \qquad [\hat{x}^2, \hat{p}^2], \qquad [\hat{x}\hat{p}, \hat{p}^2].$$
 (11)

- d) Using just the canonical commutation relations $[\hat{x}_l, \hat{p}_m] = i\hbar \delta_{lm}$, calculate $[\hat{L}_{\alpha}, \hat{L}_{\beta}]$, where $\hat{L}_{\alpha} = \varepsilon_{\alpha i j} \hat{x}_i \hat{p}_j$ is the α -component of the angular momentum operator.
- e) Now calculate $[\hat{L}_{\alpha}, \hat{L}^2]$ and $[\hat{L}_{\alpha}, \hat{p}^2]$.
